In-company training QNH
Module 5
Angular Services

Peter Kassenaar –
info@kassenaar.com

Waarom Services?

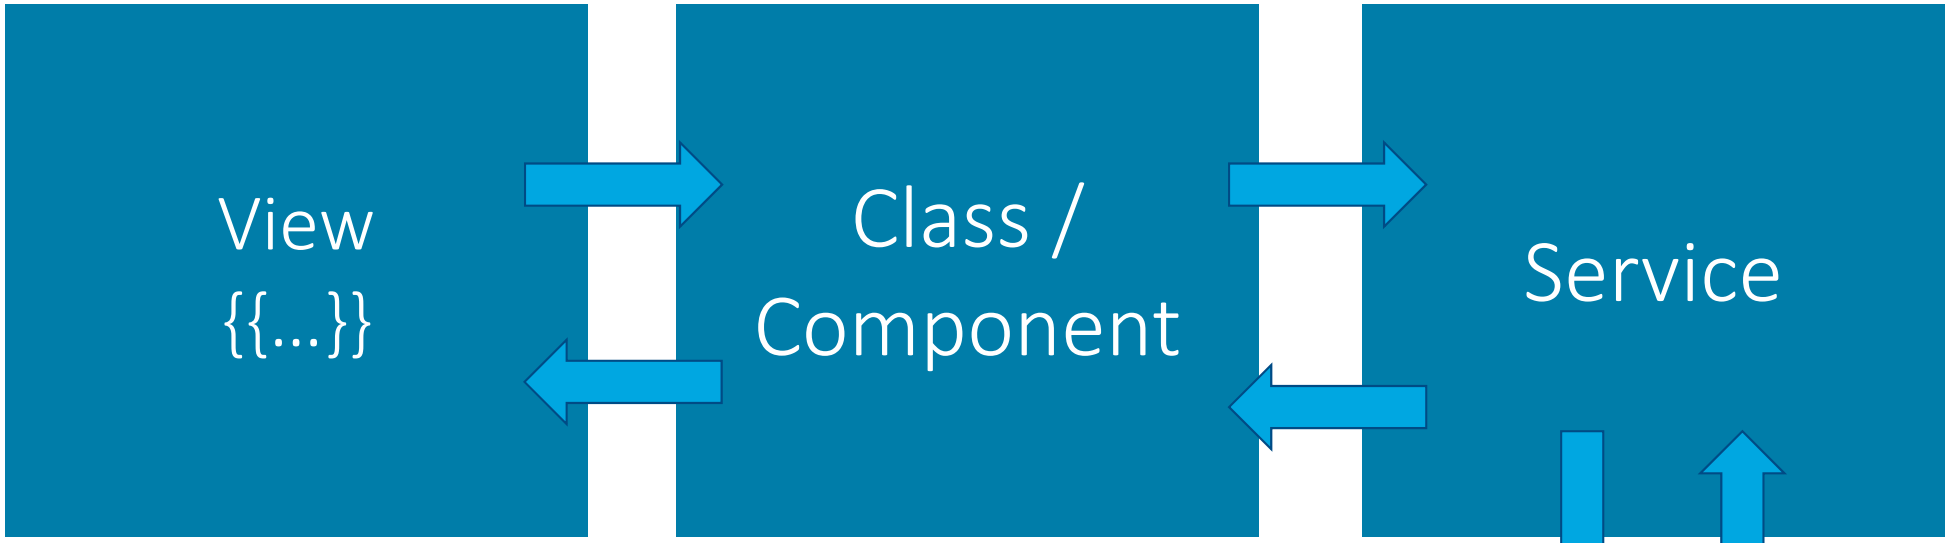
Doel – datafunctionality herbruikbaar maken voor verschillende componenten

- Data retrieval
- Data caching
- Data Storage,
- …

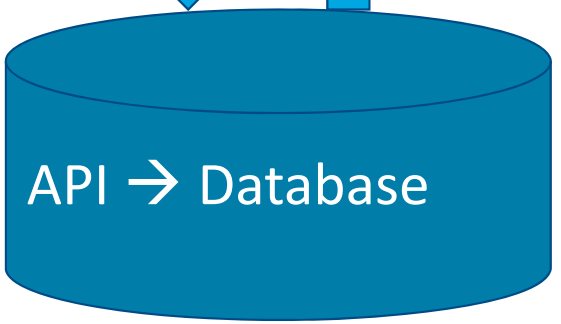
Angular 2 : één optie

- `export class myDataService { … }`

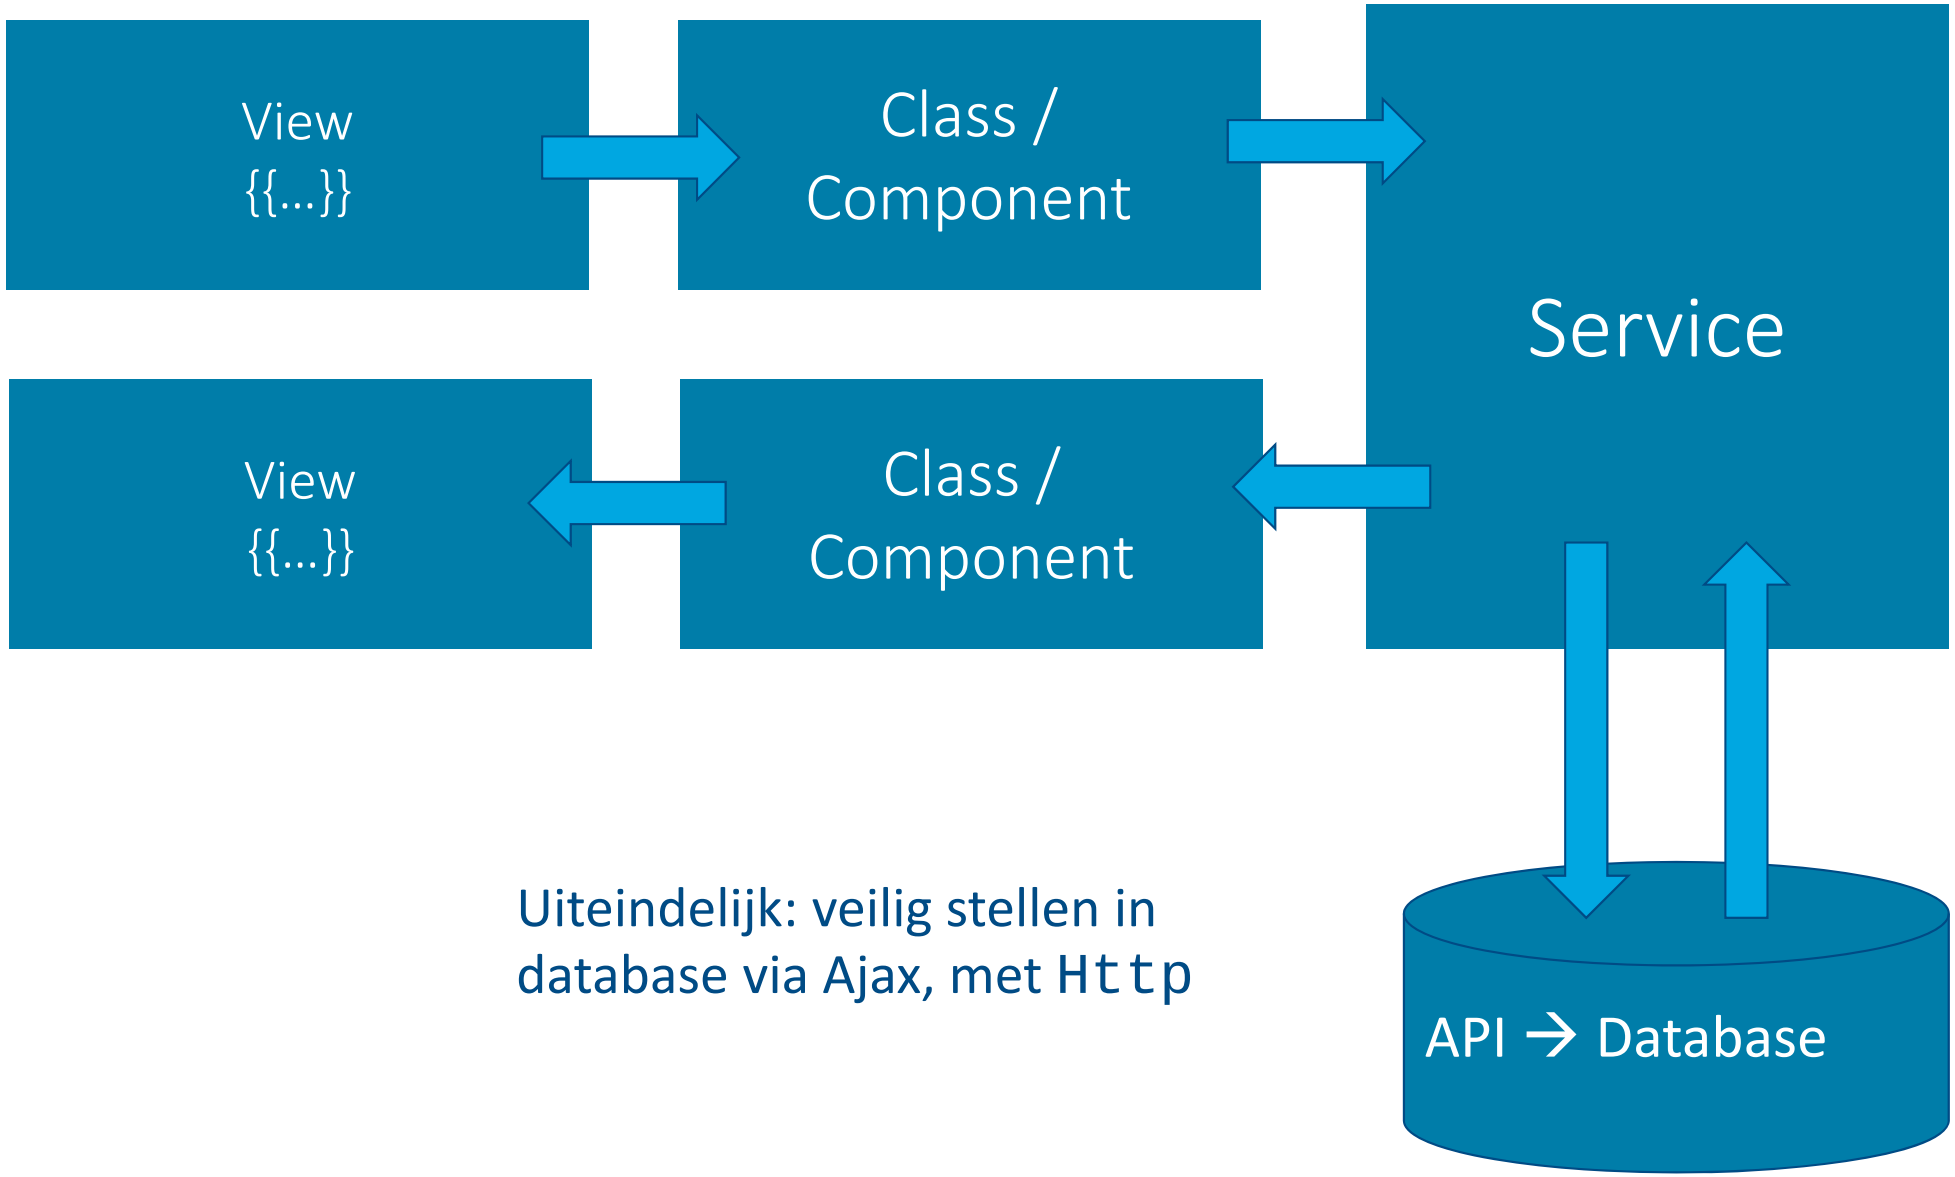
Data flow



Uiteindelijk: veilig stellen in database via Ajax, met `Http`



Bij multiple components



Uiteindelijk: veilig stellen in database via Ajax, met `Http`

Services in Angular 2

Data services in Angular 1:

```
angular.module('myApp')
  .service(…)
  .factory(…)
  .provider(…)
```

Data services in Angular 2:

```
import {Injectable} from '@angular/core';

@Injectable()
export class CityService{
   //....
}
```

De rol van @Injectable

Why? – Dependency Injection (DI) en metadata!

“TypeScript sees the @Injectable() decorator and emits metadata about our service, metadata that Angular may need to inject other dependencies into this service.”

https://angular.io/docs/ts/latest/tutorial/toh-pt4.html

“Our service doesn't have any dependencies at the moment. Add the decorator anyway.

It is a best practice to apply the `@Injectable()` decorator from the start both for consistency and for future-proofing”

Stap 1 – service maken (static data)

```
import { Injectable } from '@angular/core';
import { City } from './city.model'

@Injectable()
export class CityService {
   cities:City[] = [
      new City(1, 'Groningen', 'Groningen'),
      …
   ];

   // retourneer alle cities
   getCities() {
      return this.cities
   }

   // retourneer city op basis van ID
   getCity(id:number) {
       return this.cities.find(c => c.id === id);
   }
}
```

Stap 2 – Service consumeren/injecten

```
…
import {CityService} from "./city.service";

@Component({
   selector    : 'hello-world',
   templateUrl: 'app/app.html',
})

export class AppComponent implements OnInit {
   // Properties voor de component/class
   currentCity: City;
   cities: City[];
   cityPhoto: string;

   constructor(private cityService: CityService) {

   }

   ngOnInit() {
      this.cities = this.cityService.getCities();
   }

   getCity(city: City) {
      this.currentCity = this.cityService.getCity(city.id);
      this.cityPhoto   = `img/${this.currentCity.name}.jpg`;
      console.log('City opgehaald:', this.currentCity);
   }
}
```

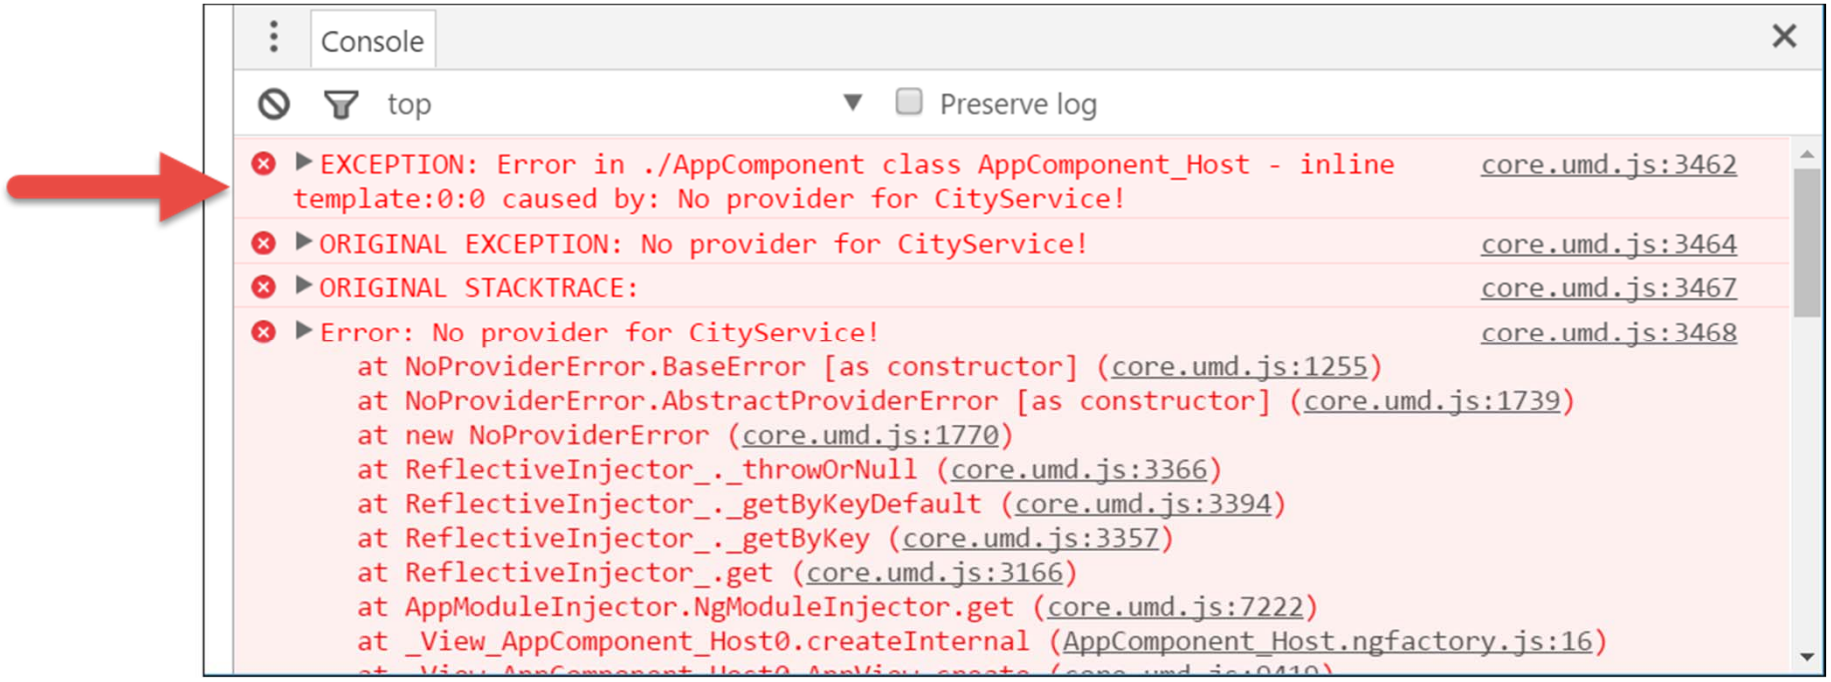
local variables

DI in Constructor: shorthand voor nieuwe private variable + instantiering!

Detailgegevens voor city bij (click) event

“No provider for CityService”

Solution: inject in `app.module.ts`



Service injecteren in Module

Alleen de *referentie* naar CityService is niet voldoende.

Angular moet de service *injecteren* in de module

Gebruik de annotatie `providers: [ … ]`

```
// Module declaration
@NgModule({
   imports      : [BrowserModule],
   declarations: [AppComponent],
   bootstrap    : [AppComponent],
   providers    : [CityService] // DI voor service
})
export class AppModule {
}
```

Array met Service-dependencies

Singleton?

Services zijn (in principe) singletons

- Maar: afhankelijk van de plek waar ze geïnstantieerd worden!
- Ze zijn een singleton voor de Component/Module en alle child components.
- Module/Site-wide gebruiken? (aanbevolen) → Instantieer service in `app.module.ts`

Checkpoint

Elke service in Angular 2 is een `class`

Services worden geannoteerd met `@Injectable()`

Service importeren in de component die hem gebruikt

Instanti ëren in `constructor()`

Service invoegen in de Module bij `providers: []`

Oefening 5a) + 5b)

Voorbeeld: `\200-services-static`

Oefening….
